Getting the First Committee

One committee. Twenty donors. One afternoon.

*A companion to the technical dossier, and a different kind of document.
The dossier is written for the person being presented to.
This one is written for the person walking into a room to ask for something.*

1 September 2026

9 What not to do 5

1. What the problem actually is

Everything else is finished. The loop closes, the law is respected, the tests pass, the site is live and installable. The one thing missing cannot be built: **nobody uses it**.

A panel will ask. The answer today is *nobody yet*, and that answer is survivable exactly once — if it is followed immediately by what is being done about it. This document is what is being done about it.

1.1 Why twenty is the right number

Not because twenty is impressive. Because twenty is the smallest number that turns every architectural claim in the dossier into evidence.

With twenty real donors in one wilaya, a request posted at nine in the evening reaches people who can actually answer it. Without them, the same request reaches nobody and proves nothing. The application does not become true at a thousand users. It becomes true at the first one who receives a notification and goes.

1.2 Why it is not as hard as it sounds

You are not recruiting twenty strangers. You are asking one person who *already has a list* to point it at something. The Croissant-Rouge committees, the university clubs and the scout groups have been organising blood donation in Algeria for decades. None of them lacks donors. What they lack is a way to reach the right ones on a Tuesday night.

2. Who to ask

Who	Why them
1 A wilaya committee of the FADS	The Fédération Algérienne des Donneurs de Sang is a federation of blood-donor associations with local committees. Its entire reason to exist is donor lists — which is the one thing this needs. The ANS names it first among its association partners.
2 A university blood-donation club	The shortest distance if you are a student. The president already has a group of donors on their phone, and nobody has to ask a head office. Fastest yes on this list.
3 A local Croissant-Rouge committee	Carries the most weight in front of a panel, and the ANS lists the CRA as a collection partner in writing. Slower: somebody must say yes on the organisation's behalf.
4 Scouts Musulmans Algériens	Also named on the ANS partnership page, and historically active in collection drives. Real lists, real trust, little bureaucracy.
5 A Facebook blood group	By far the most donors, and the least institutional weight. Useful for numbers, weak as a story.

Two different firsts. FADS is the best fit; a university club is the fastest yes. Ask both — a club that says yes this week is a reference when you go to the committee next month, and neither call costs anything.

2.1 None of this is a novel request

The ANS publishes a page listing the associations it already collects blood with: the FADS, the Scouts Musulmans Algériens, the Croissant-Rouge Algérien, Irchad wa Islah, the Rotary and Lions clubs, the UNJA and several others. Some of those partnerships are dated on the page and go back to 2015.

That matters twice. It means an association hosting a collection is ordinary rather than exceptional, so you are asking for something the organisation already does. And it means the premise this product is built on — that associations are the right partner for reaching donors — is the agency's own practice, not an assumption you made.

3. What the ANS already publishes

Before contacting anybody, three things are public and worth having in front of you. The site is served over `http`; `https` currently fails on an expired certificate, so a browser may refuse it.

Page	What is on it
<code>/centres-collectes-fixes/</code>	A national directory: 165 transfusion structures across all 58 wilayas, each with a telephone number. In Blida: CWTS CHU Blida 025 30 96 11, PTS EPH Meftah 025 33 60 04, BS EPH Boufarik 025 47 14 10.
<code>/programme-de-collectes-mobiles/</code>	A mobile-collection programme published per wilaya. Dated 2025 at the time of writing, so check whether the year has turned over before relying on it.
<code>/associations-donneur-sang/</code>	The partnership page named above. Worth reading before any meeting: it tells you what the agency already does and with whom.

Agence Nationale du Sang — (+213) 023 53 32 79 / 76 / 74, 15 route du Kadous, Tixeraine, Bir Khadem, Alger. The number is printed on the back of their mobile collection units.

4. Where to go: a blood drive

This is the single highest-yield place in the country for what you need, and the reason is simple. **Everyone at a blood drive has already said yes.** They are willing, they are present, and they are standing still.

You get the committee and the donors in the same room on the same afternoon. Nowhere else does that.

4.1 What to bring

- A phone with the app installed to the home screen, signed in.
- The invite code shown full screen — **Committee** → **Invite your donors** → **the QR button**. Hold it up, or hand the phone over.
- The same page printed on A4, taped to the table. The print button on that screen produces exactly this sheet and nothing else.
- Nothing to sign, no forms, no laptop.

The code has no letter O, no digit 0, no l and no 1 — it was designed to be read aloud across a table when somebody's camera will not focus.

5. What to say

5.1 The opening

Do not begin with the application. Begin with the thing they already know is broken.

"When you need O negative on a Thursday night, what do you actually do?"

Let them answer. They will describe ringing round, or posting on Facebook, or a WhatsApp group that half the members have muted. That answer is the product's whole reason to exist, and it is better coming from them.

5.2 The ask, which must be small

The mistake is asking somebody to adopt a platform. Ask for an afternoon.

"Can I put a code on your table for one afternoon? The people who scan it become a list you can call — and the app knows their blood type and the date they are allowed to give again."

They commit nothing. They install nothing. They keep the list.

5.3 What is in it for them, said plainly

"Next time you need a specific type, you press one button. Only donors in your wilaya, only compatible types, only the ones eligible today — and never the family who posted the request. Then you see who is coming."

That last sentence is the one that lands. Nothing they use now tells them who is coming.

6. The questions you will be asked

Answer these plainly. The weak answers are the defensive ones.

"Who are you?" A student who built this, alone, and is looking for one committee to try it. Do not inflate this. Nobody is offended by a student with something that works; several people are offended by a student pretending to be a company.

"Is this official? Approved by the Agence Nationale du Sang?" No, and say so immediately. It is built to the law — consent recorded per purpose, every contact reveal logged, no payment to donors ever — but nobody has approved it. Then add the true thing: the ANS publishes a page of the associations it collects blood with, and what is being proposed is that your committee works the same way it already does, with a tool that remembers who gave and when. Claiming an endorsement you do not have is the one mistake that cannot be recovered from; pointing at their own published practice is not claiming one.

"What happens to our donors' phone numbers?" They stay with the donor. Search shows a masked number; opening one is a deliberate act, restricted to members of an association in that wilaya, and every opening is written to a log the donor can read and *nobody* can delete. You can show them this on the phone.

"Are you taking our list?" No, and this is worth being precise about. There is no upload. Each donor signs up themselves and consents themselves; the code only records that they came

through your committee. If they walk away tomorrow, the list is still theirs, because it was never yours to take.

“We already have a Facebook group.” So does everyone, and it works until it does not. A group post reaches whoever is scrolling, cannot tell A+ from O—, does not know who gave blood six weeks ago and cannot be closed when the need is met. This does all four.

“Who pays for this?” Nobody, today. Donor payment is excluded by Algerian law and by the design — there is no charge to a donor and there never will be. Long term it is paid for by the bodies that coordinate donation, or by public funding. Say that it is unsolved rather than inventing a business model in front of somebody who will remember.

“What if it stops working?” Then they are exactly where they are now, with a phone and a list. Nothing they do today is taken away.

7. On the day: the mechanics

Ten minutes, and none of it needs a laptop.

Step
1 The committee’s representative signs up in the app like anyone else.
2 They apply as an association: Committee → Apply . Name, type, wilaya.
3 You verify them. You are the platform administrator, and verification is restricted to that role on purpose — a badge anybody could issue is not a badge.
4 They open Committee → Invite your donors and create a link. Give it a name they will recognise later, like the date of the drive.
5 Press the QR button. Hold up the phone, or print the sheet and tape it down.
6 Each donor scans, signs up, chooses their blood type, and is on the list. The count on the committee’s screen goes up as it happens.

Creating a link is restricted to an administrator of that association, because it publishes a standing invitation under the committee’s name. Volunteers can see everything and create nothing.

8. What success looks like

In order, and the second matters more than the first.

1. **Twenty donors on one committee’s list.** The count is on their screen; no spreadsheet needed.
2. **One real request, answered.** A family posts, compatible donors are notified, somebody says they are coming, and the committee watches it happen. That is the entire product, and once it has happened once it has been proven.
3. **A number you did not have before.** The committee screen reports how many requests reached a donor and how long the first one took. Today, on the demonstration data, it reads *1 of 4, 38 hours*. In a real wilaya with real donors it should read minutes — and if it does not, that is worth knowing more than any feature.

9. What not to do

- **Do not promise a partnership you do not have.** Not with the Croissant-Rouge, not with the ANS, not with a hospital. One checkable exaggeration discredits every honest figure you have.

- **Do not ask them to install anything.** A link, scanned, opening in a browser. Anything heavier and half the room stops.
- **Do not demonstrate the sign-up with a real phone number that is not yours.** The demonstration build accepts one fixed verification code, which means anybody can claim any number. Use your own.
- **Do not collect names on paper “to enter later”.** The entire argument is that nobody uploads anybody. Breaking that at the first drive would be worse than getting no donors at all.
